## Identifying Natural Areas for Conservation in Michigan's Thumb SOUTHERN LAKE HURON ASSESSMENT

**OVERVIEW** The Southern Lake Huron Assessment asked: How can the resources of the Lake Huron coastal area be enhanced and leveraged to benefit residents of and visitors to Michigan's Thumb Area, support local economies, and maintain environmental quality? One strategy is to conserve a network of natural areas for water quality, public access and recreation. This fact sheet describes one step toward this goal — an analysis to prioritize conservation efforts.

Michigan's Thumb contains a variety of natural areas such as forest, wetland, shoreline, inland lakes and streams that could be lost or degraded without additional protection. Conserving these remaining natural areas could enhance local communities. Michigan Sea Grant evaluated remaining natural areas to help natural resource managers, land conservancies and local decision makers identify important conservation opportunities and wisely invest their limited resources.

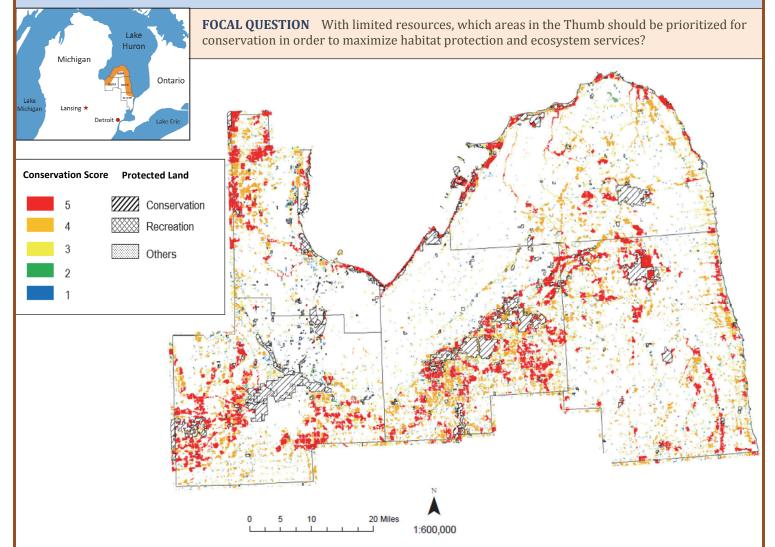

Figure 1. Map of study area and conservation scores (with 5 being the highest priority) for undeveloped land in the Thumb. Natural areas are color coded based on their value for fish and wildlife habitat.

**PROJECT DESCRIPTION** The project team identified natural areas that are currently unprotected but provide important habitat for fish and wildlife in Michigan's Thumb Area. Geographic information was used to evaluate the natural areas and give each site a score based on its physical characteristics and its potential value for fish and wildlife. The research team produced an overall map, 12 township maps, an inventory of high-priority conservation opportunities, and data indicating why certain areas are worthy of additional protection. Land conservancies, parks and public officials can use this information to engage landowners and the public and guide conservation decisions.

**RESULTS** The study identified 33,771 undeveloped patches of land, totaling 413,224 acres — about 17.1 percent of the study area. These natural areas were distributed mostly in coastal zones or river corridors. Approximately 41.6 percent of the undeveloped land (by area) and 7.17 percent of the study area in the Thumb received the highest conservation score in this analysis. This illustrates that there are many opportunities to conserve land in Michigan's Thumb to benefit wildlife, water quality, recreation and local communities.

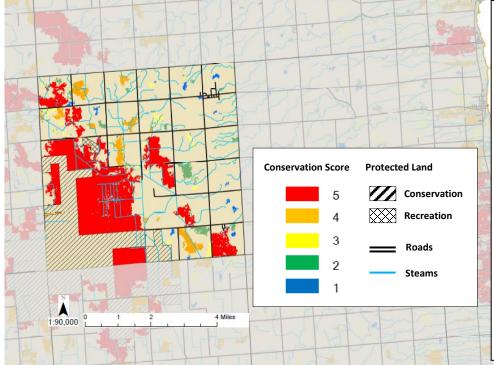

## **Identifying Natural Areas for Conservation in Michigan's Thumb**

**HOW THE AREAS WERE EVALUATED** Michigan Sea Grant conducted a series of analyses using Geographic Information System (GIS) software and a variety of data including the location, size and shape of wetlands, forests, streams, roads and parks in the region. Undeveloped patches of land in Michigan's Thumb were given an overall score, with 5 being the highest and 1 being the lowest priority for conservation based on the following:

- *Habitat Scores* Each patch of undeveloped land was evaluated based on its ability to provide habitat for five different animal groups: fish, amphibians and reptiles, raptors, waterfowl and shorebirds. For example, undeveloped lands within 0.4 km of Lake Huron provide a stop-over site for migrating landbirds and raptors and, therefore, received a higher habitat score. The five animal-specific scores were averaged creating a composite habitat score for each natural area.
- *Landscape Scores* Twelve different landscape and land cover characteristics were also used to evaluate the undeveloped patches of land. For example, natural areas that were large, adjacent to parks, contained streams and were surrounded by farms rather than pavement received a higher score because the site could provide a range of benefits for recreation, water quality and animals if adequately protected.
- Overall Conservation Score The habitat and landscape scores were added together, with each contributing equally to
  the final conservation scores shown in the maps. Statistical software was used to divide the natural areas into five
  groups based on their overall conservation score. Natural areas that received a high conservation score are seen as
  "hotspots" or high priorities for future conservation efforts.

## MINDEN TOWNSHIP

Minden has a population of about 540 people with the majority of people working in agriculture and health care. The township features the Minden City State Game Area as well as a community park in close proximity to high-priority land; these protected areas could be expanded to include additional land for conservation and recreation. This township was identified as high priority due to the presence of the Minden Bog, a large peat wetland covering about 5,000 acres or nearly 8 square miles. The Minden Bog is part of the headwaters of the Black and Cass Rivers, with about a third of the bog lying within the boundaries of the Minden City State Game Area. Nearly 80 percent of the undeveloped land is considered high-priority for conservation in part because of the large wetland area and presence of the Minden bog. As you can see from the map and tables, 14.5 percent of land is already protected for conservation and recreation, while 24.5 percent is undeveloped and unprotected.

Minden	Township	Summary	

Total land area	23,115	acres

Landuse in township	Area (acres)	Proportion
Developed land	144	1%
Farmland	8,783	40%
Grassland	4,333	20%
Forest	2,215	10%
Wetland	6,457	29%
Openwater	5	0%
Total *	21,937	100%

Natural areas *	5,669 acres
	24.5% of total area

Conservation Score	Area (acres)	Proportion
5	4,486	79%
4	583	10%
3	217	4%
2	270	5%
1	113	2%

Protected lands 3,344 acres 14.5% of total area

Figure 2. Map and summary data about Minden Township, illustrating areas that are important conservation opportunities.

<sup>\*</sup> Land patches smaller than 4 acres were not evaluated.
